AB The search for novel **anxiolytics** devoid of undesirable
side-effects typical of classical benzodiazepines (BDZs) has been intense,
and flavonoids, as a relative new class of ligands, have been shown to
possess **anxiolytic** effects in vivo. The present study evaluated
the pharmacological properties of a naturally occurring monoflavonoid,
5,7-dihydroxy-8-methoxyflavone or **wogonin**. The affinity (K(i))
of **wogonin** for the benzodiazepine site (BZD-S) on the
gamma-aminobutyric acid(A) (GABA(A)) receptor complex was 0.92 microM.
Using electrophysiological techniques, we showed that **wogonin**
enhanced the GABA-activated current in rat dorsal root ganglion neurons,
and in *Xenopus laevis* oocytes expressing recombinant rat GABA(A)
receptors, the enhancement was partially reversed by the co-application of
a 1 microM concentration of the BZD-S antagonist anexate (Ro15-1788).
Acute toxicity and behavioral effects were examined in mice. Acute lethal
activity was low, with an LD(50) of 3.9 g/kg. Oral administration of
wogonin (7.5 to 30 mg/kg) elicited an **anxiolytic**
response that was similar to that elicited by diazepam in the elevated
plus-maze; a dose-dependent increase in open arm entries and time spent in
open arms was observed. More importantly, its **anxiolytic** effect
was blocked by the co-administration of Ro15-1788. In the holeboard test,
not only did **wogonin**-treated mice experience an increased number
of head-dips but they also spent more time at it, showing no signs of
sedation. Furthermore, **wogonin** did not cause myorelaxant effects
in the horizontal wire test. Taken together, these data suggest that
wogonin exerts its **anxiolytic** effect through positive
allosteric modulation of the GABA(A) receptor complex via interaction at
the BZD-S. Its **anxiolytic** effect was not accompanied by sedative
and myorelaxant side-effects typical of BDZs.

L2 ANSWER 1 OF 290 CAPLUS COPYRIGHT 2002 ACS
ACCESSION NUMBER: 2002:657438 CAPLUS
DOCUMENT NUMBER: 137:304213
TITLE: Quantitation of the flavonoid wogonin and its major
metabolite wogonin-7.beta.-D-glucuronide in rat plasma
by liquid chromatography-tandem mass spectrometry
AUTHOR(S): Chen, Xiaoyan; Wang, Hongyan; Du, Yue; Zhong, Dafang
CORPORATE SOURCE: Laboratory of Drug Metabolism and Pharmacokinetics,
Shenyang Pharmaceutical University, Shenyang, 110016,
Peop. Rep. China

CODEN: JCBAAI; ISSN: 1570-0232
PUBLISHER: Elsevier Science B.V.
DOCUMENT TYPE: Journal
LANGUAGE: English

AB This study described the application of liq. chromatog.-tandem mass
spectrometry for the quantitation of wogonin and its major metabolite in
rat plasma. Only one conjugated metabolite with glucuronic acid was
identified by chromatog. and electrospray multi-stage mass spectrometric
assay. A derivatization reaction with 2-chlorethanol further demonstrated
that the metabolite was wogonin-7.beta.-D-glucuronide (W-7-G), not
wogonin-5.beta.-D-glucuronide. Other conjugated metabolites, e.g.,
sulfates and glucosides, were not detected. The plasma concn. of free
wogonin was detd. using atm. pressure chem. ionization source in the
selected reaction monitoring mode. The method had a lower limit of
quantitation of 0.25 ng/mL for wogonin, which offered increased
sensitivity, selectivity and speed of anal. over an existing method.
Incubation of the plasma samples with .beta.-glucuronidase allows the
quantitation of W-7-G. This quantitation method was successfully applied
to a preclin. pharmacokinetic study of wogonin and its major metabolite,
W-7-G, after an oral administration of 5 mg/kg wogonin to rats.
